SiT5357

60–220 MHz, ±0.1 to ±0.25 ppm, Stratum 3, Elite Platform™ Precision Super-TCXO

Description

The SiT5357 is a ±100 ppb precision MEMS Super-TCXO that is fully compliant to Telcordia GR-1244-CORE Stratum 3 oscillator specifications. Engineered for best dynamic performance, the SiT5357 is ideal for high reliability telecom, wireless and networking, industrial, precision GNSS and audio/video applications.

Leveraging SiTime's unique DualMEMS™ temperature sensing and TurboCompensation™ technologies, the SiT5357 delivers the best dynamic performance for timing stability in the presence of environmental stressors due to air flow, temperature perturbation, vibration, shock, and electromagnetic interference. This device also integrates multiple on-chip regulators to filter power supply noise, eliminating the need for a dedicated external LDO.

The SiT5357 offers three device configurations that can be ordered using Ordering Codes for:

1) TCXO with non-pullable output frequency,
2) VCTCXO allowing voltage control of output frequency, and
3) DCTCXO, enabling digital control of output frequency using an I^2C interface, pullable to 5 ppt (parts per trillion) resolution.

The SiT5357 can be factory programmed for any combination of frequency, stability, voltage, and pull range. Programmability enables designers to optimize clock configurations while eliminating long lead times and customization costs associated with quartz devices where each frequency is custom built.

Refer to Manufacturing Guideline for proper reflow profile and PCB cleaning recommendations to ensure best performance.

Features

- Output 60–189 MHz, and 200–220 MHz, in 1 Hz steps
- Factory programmable options for low lead time
- Best dynamic stability under airflow, thermal shock
  - ±100 ppb stability across temperature
  - ±1 ppb/°C typical frequency slope (ΔF/ΔT)
  - 3e-11 ADEV at 10 second averaging time
- -40°C to +105°C operating temperature
- No activity dips or micro jumps
- Resistant to shock, vibration and board bending
- On-chip regulators eliminate the need for external LDOs
- 2.5V, 2.8V, 3.0V and 3.3V supply voltage
- LVCMOS output
- Digital frequency pulling (DCTCXO) via I^2C
  - Digital control of output frequency and pull range
  - Up to ±3200 ppm pull range
  - Frequency pull resolution down to 5 ppt
- 2.5V, 2.8V, 3.0V and 3.3V supply voltage
- LVCMOS output
- RoHS and REACH compliant
- Pb-free, Halogen-free, Antimony-free

Applications

- 4G/5G radio, Small cell
- IEEE1588 boundary and grandmaster clocks
- Synchronous Ethernet
- Optical transport – SONET/SDH, OTN, Stratum 3
- DOCSIS 3.x remote PHY
- Precision GNSS systems
- Test and measurement

Electrical Characteristics

All Min and Max limits are specified over temperature and rated operating voltage with 15 pF output load unless otherwise stated. Typical values are at 25°C and 3.3V Vdd.

Table 1. Output Characteristics

Parameters	Symbol	Min.	Typ.	Max.	Unit	Condition
Frequency Coverage						
Nominal Output Frequency Range	F_nom	60.000001	–	189	MHz	
		200	–	220	MHz	
Temperature Range						
Operating Temperature Range	T_use	-20	–	+70	°C	Extended Commercial, ambient temperature
		-40	–	+85	°C	Industrial, ambient temperature
		-40	–	+105	°C	Extended Industrial, ambient temperature
Frequency Stability - Stratum 3+ Grade						
Initial Tolerance	F_init	-0.5	–	+0.5	ppm	Initial frequency at 25°C inclusive of solder-down shift at 48 hours after 2 reflows
Supply Voltage Sensitivity	F_Vdd	-2.5	±0.5	+2.5	ppb	Vdd ±5%
Output Load Sensitivity	F_load	-0.4	±0.05	+0.4	ppb	15 pF ±10%
Frequency Stability over Temperature	F_stab	-0.1	–	+0.1	ppm	Referenced to (max frequency + min frequency)/2 over the rated temperature range, in TCXO, DCTCXO, or VCTCXO (VCTCXO with ±6.25 ppm pull range)
Frequency vs. Temperature Slope	ΔF/ΔT	-2	±0.9	+2	ppb/°C	-20 to 85 °C
		-3.5	±1	+3.5	ppb/°C	-40 to -20 °C
		–	±0.9	–	ppb/°C	85 to 105 °C
Dynamic Frequency Change during Temperature Ramp	F_dynamic	-0.02	±0.008	+0.02	ppb/s	0.5°C/min temperature ramp rate, -20 to 85 °C
		-0.035	±0.01	+0.035	ppb/s	0.5°C/min temperature ramp rate, -40 to -20 °C
			±0.008	–	ppb/s	0.5°C/min temperature ramp rate, 85 to 105 °C
24-hour holdover Stability	F_24_Hold	-0.15	–	+0.15	ppm	Inclusive of over-temp frequency variation
Hysteresis Over Temperature	F_hys	–	±25	–	ppb	-40 to 105 °C, 0.5°C/min ramp rate
		–	±15	–	ppb	-40 to 85 °C, 0.5°C/min ramp rate
		–	±10	–	ppb	-20 to 70 °C, 0.5°C/min ramp rate
One-Day Aging	F_1d	–	±1	–	ppb	At 25°C, after 30-days of continued operation. Aging is measured with respect to day 31.
One-Year Aging	F_1y	–	±0.3	–	ppm	At 25°C, after 2-days of continued operation. Aging is measured with respect to day 3.
20-Year Aging	F_20y	–	±0.5	–	ppm	
Frequency Stability - Stratum 3 Grade						
Initial Tolerance	F_init	-1	–	+1	ppm	Initial frequency at 25°C inclusive of solder-down shift at 48 hours after 2 reflows
Supply Voltage Sensitivity	F_Vdd	-6.5	±4.2	+6.5	ppb	Vdd ±5%
Output Load Sensitivity	F_load	-1.1	±0.3	+1.1	ppb	15 pF ±10%
Frequency Stability over Temperature	F_stab	-0.2	–	+0.2	ppm	Referenced to (max frequency + min frequency)/2 over the rated temperature range. Vc=Vdd/2 for VCTCXO
		-0.25	–	+0.25	ppm	
Frequency vs. Temperature Slope	ΔF/ΔT	-10	±6.4	+10	ppb/°C	-40 to 105 °C
Dynamic Frequency Change during Temperature Ramp	F_dynamic	-0.08	±0.05	+0.08	ppb/s	0.5°C/min temperature ramp rate
24-hour holdover Stability	F_24_Hold	-0.32	–	+0.32	ppm	Inclusive of over-temperature frequency variation
One-Day Aging	F_1d	-5	±3	+5	ppb	At 25°C, after 30-days of continued operation. Aging is measured with respect to day 31.
One-Year Aging	F_1y	–	±1	–	ppm	At 25°C, after 2-days of continued operation. Aging is measured with respect to day 3.
20-Year Aging	F_20y	–	±2	–	ppm	
20-Year Total Stability	F_tot_20y	-4.6	–	+4.6	ppm	Complies with Stratum 3, per GR-1244-CORE. Actual performance is better.
LVCMOS Output Characteristics						
Duty Cycle	DC	45	–	55	%	60 to 150 MHz
		42	–	55	%	150 to 189 MHz, 200 to 220 MHz
Rise/Fall Time	Tr, Tf	0.8	1.2	1.9	ns	10% - 90% Vdd
Output Voltage High	VOH	90%	–	–	Vdd	IOH = +3mA
Output Voltage Low	VOL	–	–	10%	Vdd	IOL = -3mA

Downloaded from Arrow.com.

Table 1. Output Characteristics (continued)

Parameters	Symbol	Min.	Typ.	Max.	Unit	Condition
Start-up Characteristics						
Start-up Time	T_start	–	2.5	3.5	ms	Time to first pulse, measured from the time Vdd reaches 90% of its final value. Vdd ramp time = 100 µs from 0V to Vdd
Output Enable Time	T_oe	–	–	285	ns	See Timing Diagrams section below.
First Pulse Accuracy	T_stability	–	5	45	ms	Time to first accurate pulse within rated stability, measured from the time Vdd reaches 90% of its final value. Vdd ramp time = 100 µs

Downloaded from Arrow.com.

Table 2. DC Characteristics

Parameters	Symbol	Min.	Typ.	Max.	Unit	Condition
Supply Voltage						
Supply Voltage	Vdd	2.25	2.5	2.75	V	Contact SiTime for 2.25V to 3.63V continuous supply voltage support.
		2.52	2.8	3.08	V	
		2.7	3.0	3.3	V	
		2.97	3.3	3.63	V	
Current Consumption						
Current Consumption	Idd	–	48	62	mA	F_nom = 100 MHz, No Load, TCXO and DCTCXO modes
		–	52	66	mA	F_nom = 100 MHz, No Load, VCTCXO mode
OE Disable Current	I_od	–	45	52	mA	OE = GND, output weakly pulled down. TCXO, DCTCXO
		–	49	56	mA	OE = GND, output weakly pulled down. VCTCXO mode

Table 3. Input Characteristics

Parameters	Symbol	Min.	Typ.	Max.	Unit	Condition
Input Characteristics – OE Pin						
Input Impedance	Z_in	75	–	–	kΩ	Internal pull up to Vdd
Input High Voltage	VIH	70%	–	–	Vdd	
Input Low Voltage	VIL	–	–	30%	Vdd	
Frequency Tuning Range – Voltage Control or I^2C mode						
Pull Range	PR	±6.25	–	–	ppm	VCTCXO mode. Contact SiTime for ±12.5 and ±25 ppm.
		±6.25 ±10 ±12.5 ±25 ±50 ±80 ±100 ±125 ±150 ±200 ±400 ±600 ±800 ±1200 ±1600 ±3200	–	–	ppm	DCTCXO mode
Absolute Pull Range[0]	APR	±5.15	–	–	ppm	±0.1 ppm F_stab, DCTCXO, VCTCXO for PR = ±6.25 ppm
		±3.05	–	–	ppm	±0.2 ppm F_stab, DCTCXO, VCTCXO for PR = ±6.25 ppm
		±3.00	–	–	ppm	±0.25 ppm F_stab, DCTCXO, VCTCXO for PR = ±6.25 ppm
Upper Control Voltage	VC_U	90%	–	–	Vdd	VCTCXO mode
Lower Control Voltage	VC_L	–	–	10%	Vdd	VCTCXO mode
Control Voltage Input Impedance	VC_z	8	–	–	MΩ	VCTCXO mode
Control Voltage Input Bandwidth	VC_bw	–	10	–	kHz	VCTCXO mode; contact SiTime for other bandwidth options.
Frequency Control Polarity	F_pol		Positive			VCTCXO mode
Pull Range Linearity	PR_lin	–	0.5	1.0	%	VCTCXO mode
I^2C Interface Characteristics, 200 Ohm, 550 pF (Max I^2C Bus Load)						
Bus Frequency	F_I2C	–	100	–	kHz	-40 to 105 °C
		–	400	–	kHz	-40 to 105 °C
		–	1000	–	kHz	-40 to 85 °C
Input Voltage Low	VIL_I2C	–	–	30%	Vdd	DCTCXO mode
Input Voltage High	VIH_I2C	70%	–	–	Vdd	DCTCXO mode
Output Voltage Low	VOL_I2C	–	–	0.4	V	DCTCXO mode
Input Leakage current	I_L	0.5	–	24	µA	0.1 V_{DD}< VOUT < 0.9 $V_{DD.}$ Includes typical leakage current from 200 kΩ pull resister to VDD. DCTCXO mode
Input Capacitance	C_{IN}	–	–	5	pF	DCTCXO mode

Note:

3. PR = PR – initial tolerance – 20-year aging – frequency stability over temperature. Refer to Table 14 for APR with respect to other pull range options.

Table 6. Absolute Maximum Limits

Attempted operation outside the absolute maximum ratings may cause permanent damage to the part.
Actual performance of the IC is only guaranteed within the operational specifications, not at absolute maximum ratings.

Parameter	Test Conditions	Value	Unit
Storage Temperature		-65 to 125	°C
Continuous Power Supply Voltage Range (Vdd)		-0.5 to 4	V
Human Body Model (HBM) ESD Protection	JESD22-A114	2000	V
Soldering Temperature (follow standard Pb-free soldering guidelines)		260	°C
Junction Temperature[4]		130	°C

Note:
4. Exceeding this temperature for an extended period of time may damage the device.

Table 7. Thermal Considerations[5]

Package	θJA (°C/W)	θJC, Bottom (°C/W)
Ceramic 5.0 x 3.2 mm²	54	15

Note:
5. Measured in still air.

Table 8. Maximum Operating Junction Temperature[6]

Max Operating Temperature (ambient)	Maximum Operating Junction Temperature
70°C	**80°C**
85°C	**95°C**
105°C	**115°C**

Note:
6. Datasheet specifications are not guaranteed if junction temperature exceeds the maximum operating junction temperature.

Table 9. Environmental Compliance

Parameter	Test Conditions	Value	Unit
Mechanical Shock Resistance	**MIL-STD-883F, Method 2002**	**10000**	*g*
Mechanical Vibration Resistance	**MIL-STD-883F, Method 2007**	**70**	*g*

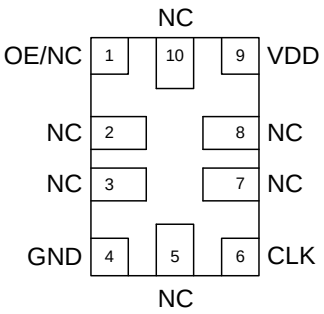

Figure 3. TCXO

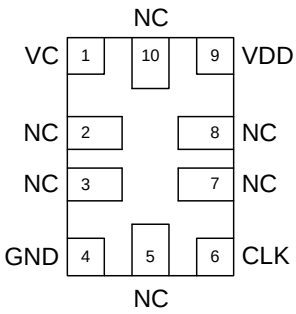

Figure 4. VCTCXO

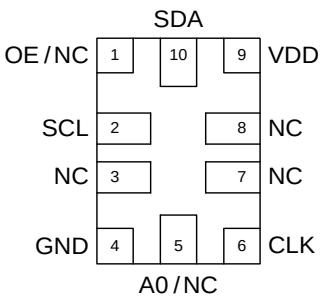

Figure 5. DCTCXO

Table 11. Pin Description

Pin	Symbol	I/O	Internal Pull-up/Pull Down Resistor	Function
1	OE/NC/VC	OE – Input	100 kΩ Pull-Up	H[7]: specified frequency output L: output is high impedance. Only output driver is disabled.
		NC[8] – No Connect	–	H or L or Open: No effect on output frequency or other device functions
		VC – Input	–	Control Voltage in VCTCXO Mode
2	SCL / NC[8]	SCL – Input	200 kΩ Pull-Up	I²C serial clock input.
		No Connect		H or L or Open: No effect on output frequency or other device functions
3	NC[8]	No Connect	–	H or L or Open: No effect on output frequency or other device functions
4	GND	Power	–	Connect to ground
5	A0 / NC[8]	A0 – Input	100 kΩ Pull-Up	Device I²C address when the address selection mode is via the A0 pin. This pin is NC when the I²C device address is specified in the ordering code. A0 Logic Level — I²C Address 0 — 1100010 1 — 1101010
		NC – No Connect	–	H or L or Open: No effect on output frequency or other device functions.
6	CLK	Output	–	LVCMOS
7	NC[8]	No Connect	–	H or L or Open: No effect on output frequency or other device functions
8	NC[8]	No Connect	–	H or L or Open: No effect on output frequency or other device functions
9	VDD	Power	–	Connect to VDD[8]
10	SDA / NC[8]	SDA – Input/Output	200 kΩ Pull Up	I²C Serial Data.
		NC – No Connect	–	H or L or Open: No effect on output frequency or other device functions.

Notes:

7. In OE mode for noisy environments, a pull-up resistor of 10 kΩ or less is recommended if pin 1 is not externally driven. If pin 1 needs to be left floating, use the NC option.
8. A 0.1 µF capacitor in parallel with a 10 µF capacitor are required between Vdd and GND. The 0.1 µF capacitor is recommended to place close to the device, and place the 10 µF capacitor less than 2 inches away.
9. All NC pins can be left floating and do not need to be soldered down.

Architecture Overview

Based on SiTime's innovative Elite Platform™, the SiT5357 delivers exceptional dynamic performance, i.e. resilience to environmental stressors such as shock, vibration, and fast temperature transients. Underpinning the Elite platform are SiTime's unique DualMEMS™ temperature sensing architecture and TurboCompensation™ technologies.

DualMEMS is a noiseless temperature compensation scheme. It consists of two MEMS resonators fabricated on the same die substrate. The TempFlat™ resonator is designed with a flat frequency characteristic over temperature whereas the temperature sensing resonator is by design sensitive to temperature changes. The ratio of frequencies between these two resonators provides an accurate reading of the resonator temperature with 20 µK resolution.

By placing the two MEMS resonators on the same die, this temperature sensing scheme eliminates any thermal lag and gradients between resonator and temperature sensor, thereby overcoming an inherent weakness of legacy quartz TCXOs.

The DualMEMS temperature sensor drives a state-of-the-art CMOS temperature compensation circuit. The TurboCompensation design, with >100 Hz compensation bandwidth, achieves a dynamic frequency stability that is far superior to any quartz TCXO. The digital temperature compensation enables additional optimization of frequency stability and frequency slope over temperature within any chosen temperature range for a given system design.

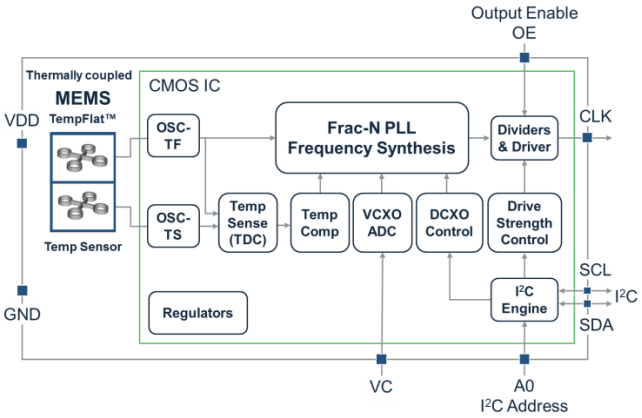

Figure 31. Elite Architecture

The Elite platform also incorporates a high resolution, low noise frequency synthesizer along with the industry standard I^2C bus. This unique combination enables system designers to digitally control the output frequency in steps as low as 5 ppt and over a wide range up to ±3200 ppm.

For more information regarding the Elite platform and its benefits please visit:

- SiTime's breakthroughs section
- TechPaper: DualMEMS Temperature Sensing Technology
- TechPaper: DualMEMS Resonator TDC

Functional Overview

The SiT5357 is designed for maximum flexibility with an array of factory programmable options, enabling system designers to configure this precision device for optimal performance in a given application.

Frequency Stability

The SiT5357 comes in two factory-trimmed stability grades that are optimized for different applications. Both Stratum 3+ and Stratum 3 devices are compliant with Stratum 3 stability of ±4.6 ppm over 20 years.

Table 12. Stability Grades vs. Ordering Codes

Grade	Frequency Slope (ΔF/ΔT)	Frequency Stability Over Temperature	Ordering Code
Stratum 3+	±3.5 ppb/°C	±0.1 ppm	Q
Stratum 3	±10 ppb/°C	±0.2 ppm	P
		±0.25 ppm	N

- Stratum 3+ grade with ΔF/ΔT of ±3.5 ppb/°C is engineered to provide significantly better performance than legacy quartz TCXOs in time and phase synchronization applications such as IEEE1588, small cells, and 5G C-RAN (cloud RAN).
- Stratum 3 grade is designed to replace classic Stratum 3 TCXOs in applications such as SyncE with better dynamic performance and shorter lead time.

Output Frequency and Format

The SiT5357 can be factory programmed for an output frequency without sacrificing lead time or incurring an upfront customization cost typically associated with custom-frequency quartz TCXOs.

Output Frequency Tuning

In addition to the non-pullable TCXO, the SiT5357 can also support output frequency tuning through either an analog control voltage (VCTCXO), or I^2C interface (DCTCXO). The I^2C interface enables 16 factory programmed pull-range options from ±6.25 ppm to ±3200 ppm. The pull range can also be reprogrammed via I^2C to any supported pull-range value.

Refer to Device Configuration section for details.

Downloaded from Arrow.com.

Pin 1 Configuration (OE, VC, or NC)

Pin 1 of the SiT5357 can be factory programmed to support three modes: Output Enable (OE), Voltage Control (VC), or No Connect (NC).

Table 13. Pin Configuration Options

Pin 1 Configuration	Operating Mode	Output
OE	TCXO/DCTCXO	Active or High-Z
NC	TCXO/DCTCXO	Active
VC	VCTCXO	Active

When pin 1 is configured as OE pin, the device output is guaranteed to operate in one of the following two states:

- Clock output with the frequency specified in the part number when Pin 1 is pulled to logic high
- Hi-Z mode with weak pull down when pin 1 is pulled to logic low.

When pin 1 is configured as NC, the device is guaranteed to output the frequency specified in the part number at all times, regardless of the logic level on pin 1.

In the VCTCXO configuration, the user can fine-tune the output frequency from the nominal frequency specified in the part number by varying the pin 1 voltage. The guaranteed allowable variation of the output frequency is specified as pull range. A VCTCXO part number must contain a valid pull-range ordering code.

Device Configurations

The SiT5357 supports 3 device configurations – TCXO, VCTCXO, and DCTCXO. The TCXO and VCTCXO options are directly compatible with the quartz TCXO and VCTCXO. The DCTCXO configuration provides performance enhancement by eliminating VCTCXO's sensitivity to control voltage noise with an I^2C digital interface for frequency tuning.

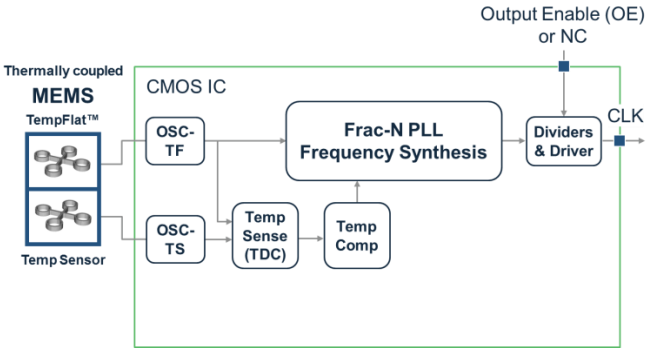

Figure 32. Block Diagram – TCXO

TCXO Configuration

The TCXO configuration generates a fixed frequency output, as shown in Figure 32. The frequency is specified by the user in the frequency field of the device ordering code and then factory programmed. Other factory programmable options include supply voltage, and pin 1 functionality (OE or NC).

Refer to the Ordering Information section at the end of the datasheet for a list of all ordering options.

Downloaded from Arrow.com.

VCTCXO Configuration

A VCTCXO, shown in Figure 33, is a frequency control device whose output frequency is an approximately linear function of control voltage applied to the voltage control pin. VCTCXOs have a number of use cases including the VCO portion of a jitter attenuation/jitter cleaner PLL Loop.

The SiT5357 achieves a 10x better pull range linearity of <0.5% via a high-resolution fractional PLL compared with 5% to 10% typical of quartz VCTCXOs that rely on pulling a resonator. By contrast, quartz-based VCTCXOs change output frequency by varying the capacitive load of a crystal resonator using varactor diodes, which results in poor linearity.

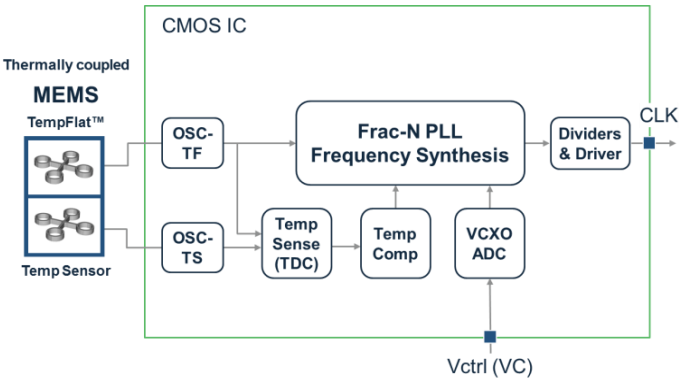

Figure 33. Block Diagram – VCTCXO

Note that the output frequency of the VCTCXO is proportional to the analog control voltage applied to pin 1. Because this control signal is analog and directly controls the output frequency, care must be taken to minimize noise on this pin.

The nominal output frequency is factory programmed per the customer's request to 6 digits of precision and is defined as the output frequency when the control voltage equals Vdd/2. The maximum output frequency variation from this nominal value is set by the pull range, which is also factory programmed to the customer's desired value and specified by the ordering code. The Ordering Information section shows all ordering options and associated ordering codes.

Refer to Appendix 1 Design Considerations with VCTCXO for more information on critical VCTCXO parameters including pull range linearity, absolute pull range, control voltage bandwidth, and Kv.

Downloaded from Arrow.com.

DCTCXO Configuration

The SiT5357 offers digital control of the output frequency, as shown in Figure 34. The output frequency is controlled by writing frequency control words over the I^2C interface.

There are several advantages of DCTCXOs relative to VCTCXOs:

1) Frequency control resolution as low as 5 ppt. This high resolution minimizes accumulated time error in synchronization applications.
2) Lower system cost – A VCTCXO may need a Digital to Analog Converter (DAC) to drive the control voltage input. In a DCTXCO, the frequency control is achieved digitally by register writes to the control registers via I^2C, thereby eliminating the need for a DAC.
3) Better noise immunity – The analog signal used to drive the voltage control pin of a VCTCXO can be sensitive to noise, and the trace over which the signal is routed can be susceptible to noise coupling from the system. The DCTCXO does not suffer from analog noise coupling since the frequency control is performed digitally through I^2C.
4) No frequency-pull non-linearity – The frequency pulling is achieved via fractional feedback divider of the PLL, eliminating any pull non-linearity concerns typical of quartz-based VCTCXOs. This improves dynamic performance in closed-loop applications.
5) Programmable wide pull range – The DCTCXO pulling mechanism is via the fractional feedback divider and is therefore not constrained by resonator pullability as in quartz-based solutions. The SiT5357 offers 16 frequency pull-range options from ±6.25ppm to ±3200 ppm, providing system designers great flexibility.

Refer to Appendix 2 Design Considerations with DCTCXO for more information on critical DCTCXO parameters including pull range, absolute pull range, frequency output, and I^2C control registers.

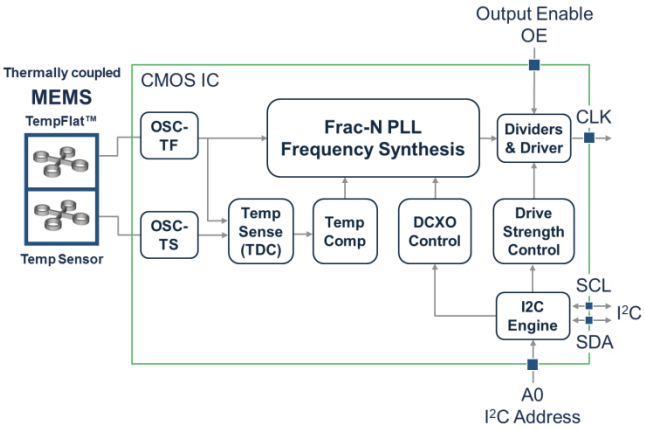

Figure 34. Block Diagram

VCXO-Specific Design Considerations

Linearity

In any VCTCXO, there will be some deviation of the frequency-voltage (FV) characteristic from an ideal straight line. Linearity is the ratio of this maximum deviation to the total pull range, expressed as a percentage. Figure 35 below shows the typical pull linearity of a SiTime VCTCXO. The linearity is excellent (1% maximum) relative to most quartz offerings because the frequency pulling is achieved with a PLL rather than varactor diodes.

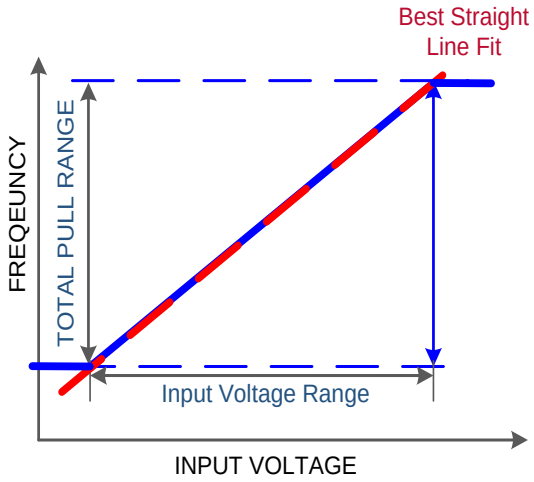

Figure 35. Typical SiTime VCTCXO Linearity

Control Voltage Bandwidth

Control voltage bandwidth, sometimes called “modulation rate” or “modulation bandwidth”, indicates how fast a VCO can respond to voltage changes at its input. The ratio of the output frequency variation to the input voltage variation, previously denoted by K_V, has a low-pass characteristic in most VCTCXOs. The control voltage bandwidth equals the modulating frequency where the output frequency deviation equals 0.707 (e.g. -3 dB) of its DC value, for DC inputs swept in the same voltage range.

For example, a part with a ±6.25 ppm pull range and a 0-3V control voltage can be regarded as having an average KV of 4.17 ppm/V (12.5 ppm/3V = 4.17 ppm/V). Applying an input of 1.5V DC ± 0.5V (1.0 V to 2.0V) causes an output frequency change of 4.17 ppm (±2.08 ppm). If the control voltage bandwidth is specified as 10 kHz, the peak-to-peak value of the output frequency change will be reduced to 4.33 ppm/√2 or 2.95 ppm, as the frequency of the control voltage change is increased to 10 kHz.

FV Characteristic Slope K_V

The slope of the FV characteristic is a critical design parameter in many low bandwidth PLL applications. The slope is the derivative of the FV characteristic – the deviation of frequency divided by the control voltage change needed to produce that frequency deviation, over a small voltage span, as shown below:

$$K_V = \frac{\Delta f_{out}}{\Delta V_{in}}$$

It is typically expressed in kHz/Volt, MHz/Volt, ppm/Volt, or similar units. This slope is usually called “K_V” based on terminology used in PLL designs.

The extreme linear characteristic of the SiTime SiT5357 VCTCXO family means that there is very little K_V variation across the whole input voltage range (typically <1%), significantly reducing the design burden on the PLL designer. Figure 36 below illustrates the typical K_V variation.

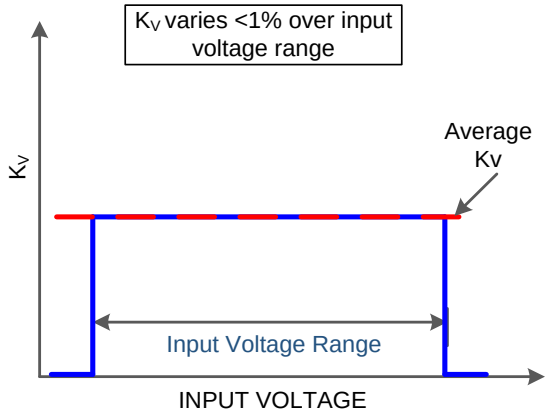

Figure 36. Typical SiTime K_V Variation

Downloaded from Arrow.com.

Pull Range, Absolute Pull Range

Pull range (PR) is the amount of frequency deviation that will result from changing the control voltage over its maximum range under nominal conditions.

Absolute pull range (APR) is the guaranteed controllable frequency range over all environmental and aging conditions. Effectively, it is the amount of pull range remaining after taking into account frequency stability, tolerances over variables such as temperature, power supply voltage, and aging, i.e.:

$$APR = PR - F_{stability} - F_{aging}$$

where $F_{stability}$ is the device frequency stability due to initial tolerance and variations on temperature, power supply, and load.

Figure 37 shows a typical SiTime VCTCXO FV characteristic. The FV characteristic varies with conditions, so that the frequency output at a given input voltage can vary by as much as the specified frequency stability of the VCTCXO. For such VCTCXOs, the frequency stability and APR are independent of each other. This allows very wide range of pull options without compromising frequency stability.

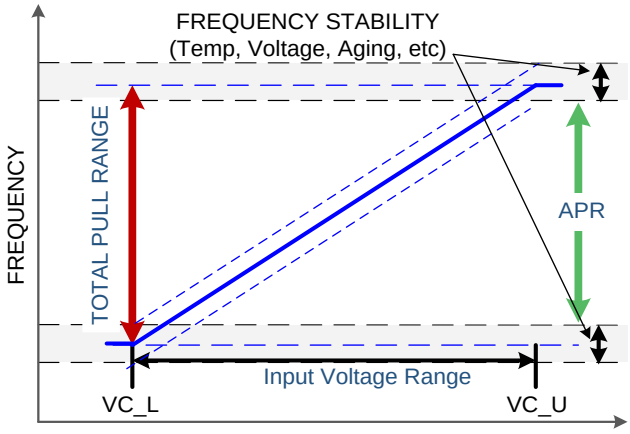

Figure 37. Typical SiTime VCTCXO FV Characteristic

The upper and lower control voltages are the specified limits of the input voltage range as shown in Figure 37 above. Applying voltages beyond the upper and lower voltages do not result in noticeable changes of output frequency. In other words, the FV characteristic of the VCTCXO saturates beyond these voltages. Figures 1 and 2 show these voltages as Lower Control Voltage (VC_L) and Upper Control Voltage (VC_U).

Table 14 below shows the pull range and corresponding APR values for each of the frequency vs. temperature ordering options.

Table 14. VCTCXO Pull Range, APR Options[12] Typical unless specified otherwise. Pull range (PR) is ±6.25 ppm.

Pull Range Ordering Code	Device Option(s)	APR ppm ±0.1 ppm option ±0.5 ppm 20-year aging	APR ppm ±0.2 ppm option ±2 ppm 20-year aging	APR ppm ±0.25 ppm option ±2 ppm 20-year aging
T	VCTCXO	±5.15	±3.05	±3.0

Notes:
12. APR includes initial tolerance, frequency stability vs. temperature, and the corresponding 20-year aging.

Downloaded from Arrow.com.

DCTCXO-Specific Design Considerations

Pull Range and Absolute Pull Range

Pull range and absolute pull range are described in the previous section. Table 15 below shows the pull range and corresponding APR values for each of the frequency vs. temperature ordering options.

Table 15. APR Options[13]

Pull Range Ordering Code	Pull Range ppm	APR ppm ±0.1 ppm option ±0.5 ppm 20-year aging	APR ppm ±0.2 ppm option ±2 ppm 20-year aging	APR ppm ±0.25 ppm option ±2 ppm 20-year aging
T	±6.25	±5.15	±3.05	±3.0
R	±10	±8.90	±6.80	±6.75
Q	±12.5	±11.4	±9.3	±9.25
M	±25	±23.9	±21.8	±21.75
B	±50	±48.9	±46.8	±46.75
C	±80	±78.9	±76.8	±76.75
E	±100	±98.9	±96.8	±96.75
F	±125	±123.9	±121.8	±121.75
G	±150	±148.9	±146.8	±146.75
H	±200	±198.9	±196.8	±196.75
X	±400	±398.9	±396.8	±396.75
L	±600	±598.9	±596.8	±596.75
Y	±800	±798.9	±796.8	±796.75
S	±1200	±1198.9	±1196.8	±1196.75
Z	±1600	±1598.9	±1596.8	±1596.75
U	±3200	±3198.9	±3196.8	±3196.75

Notes:
13. APR includes initial tolerance, frequency stability vs. temperature and the corresponding 20-year aging.

Downloaded from Arrow.com.

Output Frequency

The device powers up at the nominal operating frequency and pull range specified by the ordering code. After power-up both pull range and output frequency can be controlled via I^2C writes to the respective control registers. The maximum output frequency change is constrained by the pull range limits.

The pull range is specified by the value loaded in the digital pull-range control register. The 16 pull range choices are specified in the control register and range from ±6.25 ppm to ±3200 ppm.

Table 16 below shows the frequency resolution versus pull range programmed value

Table 16. Frequency Resolution versus Pull Range

Programmed Pull Range	Frequency Resolution
±6.25ppm	$5x10^{-12}$
±10ppm	$5x10^{-12}$
±12.5ppm	$5x10^{-12}$
±25ppm	$5x10^{-12}$
±50ppm	$5x10^{-12}$
±80ppm	$5x10^{-12}$
±100ppm	$5x10^{-12}$
±120ppm	$5x10^{-12}$
±150ppm	$5x10^{-12}$
±200ppm	$5x10^{-12}$
±400ppm	$1x10^{-11}$
±600ppm	$1.4x10^{-11}$
±800ppm	$2.1x10^{-11}$
±1200ppm	$3.2x10^{-11}$
±1600ppm	$4.7x10^{-11}$
±3200ppm	$9.4x10^{-11}$

The ppm frequency offset is specified by the 26 bit DCXO frequency control register in two's complement format as described in the I^2C Register Descriptions. The power up default value is 00000000000000000000000000b which sets the output frequency at its nominal value (0 ppm). To change the output frequency, a frequency control word is written to 0x00[15:0] (Least Significant Word) and 0x01[9:0] (Most Significant Word). The LSW value should be written first followed by the MSW value; the frequency change is initiated after the MSW value is written.

Bits	25:24	23:20	19:16	15:12	11:8	7:4	3:0
Value (Hex)	10	0000	0000	0000	0000	0000	0000
Dec. Value	-(2^{25}) = -33,554,432						

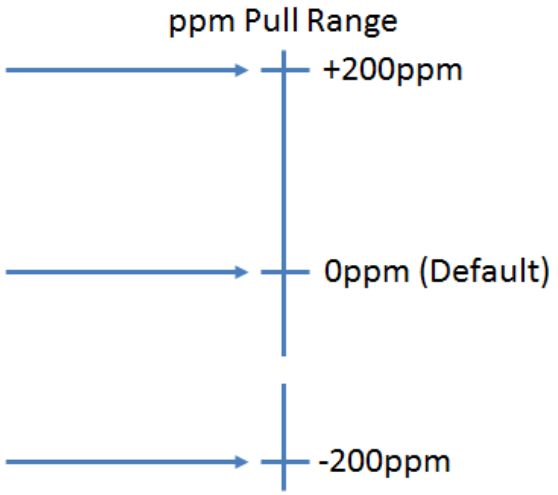

Figure 38. Pull Range and Frequency Control Word

Figure 38 shows how the two's complement signed value of the frequency control word sets the output frequency within the ppm pull range set by 0x02:[3:0]. This example shows use of the ±200 ppm pull range. Therefore, to set the desired output frequency, one just needs to calculate the fraction of full scale value ppm, convert to two's complement binary, and then write these values to the frequency control registers.

The following formula generates the control word value:

Control word value = RND((2^{25}-1) × ppm shift from nominal/pull range), where RND is the rounding function which rounds the number to the nearest whole number. Two examples follow, assuming a ±200 ppm pull range:

Example 1:

- Default Output Frequency = 98.304 MHz
- Desired Output Frequency = 98.31284736 MHz (90 ppm)

2^{25}-1 corresponds to +200 ppm, and the fractional value required for +90 ppm can be calculated as follows.

- 90 ppm / 200 ppm × (2^{25}-1) = 15,099,493.95.

Rounding to the nearest whole number yields 15,099,494 and converting to two's complement gives a binary value of 111001100110011001100110, or E66666 in hex.

Example 2:

- Default Output Frequency = 155.52 MHz
- Desired Output Frequency = 155.512224 MHz (-50 ppm)

Following the formula shown above,

- (-50 ppm / 200 ppm) × (2^{25}-1) = -8,388,607.75.

Rounding this to the nearest whole number results in -8,388,608.

Converting this to two's complement binary results in 111000000000000000000000000, or 3800000 in hex.

To summarize, the procedure for calculating the frequency control word associated with a given ppm offset is as follows:

1) Calculate the fraction of the half-pull range needed. For example, if the total pull range is set for ±100 ppm and a +20 ppm shift from the nominal frequency is needed, this fraction is 20 ppm/100 ppm = 0.2
2) Multiply this fraction by the full-half scale word value, 2^{25}-1 = 33,554,431, round to the nearest whole number, and convert the result to two's complement binary. Following the +20ppm example, this value is 0.2 × 33,554,431 = 6,710,886.2 and rounded to 6,710,886.
3) Write the two's complement binary value starting with the Least Significant Word (LSW) 0x00[16:0], followed by the Most Significant Word (MSW), 0x01[9:0]. If the user desires that the output remains enabled while changing the frequency, a 1 must also be written to the OE control bit 0x01[10] if the device has software OE Control Enabled.

It is important to note that the maximum Digital Control update rate is 38 kHz regardless of I^2C bus speed.

I²C Control Registers

The SiT5357 enables control of frequency pull range, frequency pull value, and Output Enable via I²C writes to the control registers. Table 17 below shows the register map summary, and detailed register descriptions follow.

Table 17. Register Map Summary

Address	Bits	Access	Description
0x00	[15:0]	RW	DIGITAL FREQUENCY CONTROL LEAST SIGNIFICANT WORD (LSW)
0x01	[15:11]	R	NOT USED
	[10]	RW	OE Control. This bit is only active if the output enable function is under software control. If the device is configured for hardware control using the OE pin, writing to this bit has no effect.
	[9:0]	RW	DIGITAL FREQUENCY CONTROL MOST SIGNIFICANT WORD (MSW)
0x02	[15:4]	R	NOT USED
	[3:0]	RW	DIGITAL PULL RANGE CONTROL

Register Descriptions

Register Address: 0x00. Digital Frequency Control Least Significant Word (LSW)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Name	DIGITAL FREQUENCY CONTROL LEAST SIGNIFICANT WORD (LSW)[15:0]															

Bits	Name	Access	Description
15:0	DIGITAL FREQUENCY CONTROL LEAST SIGNIFICANT WORD	RW	Bits [15:0] are the lower 16 bits of the 26 bit FrequencyControlWord and are the Least Significant Word (LSW). The upper 10 bits are in regsiter 0x01[9:0] and are the Most Significant Word (MSW). The lower 16 bits together with the upper 10 bits specify a 26-bit frequency control word. This power-up default values of all 26 bits are 0 which sets the output frequency at its nominal value. After power-up, the system can write to these two registers to pull the frequency across the pull range. The register values are two's complement to support positive and negative control values. The LSW value should be written before the MSW value because the frequency change is initiated when the new values are loaded into the MSW. More details and examples are discussed in the previous section.

Serial Interface Configuration Description

The SiT5357 includes an I^2C interface to access registers that control the DCTCXO frequency pull range, and frequency pull value. The SiT5357 I^2C slave-only interface supports clock speeds up to 1 MHz. The SiT5357 I^2C module is based on the I^2C specification, UM1024 (Rev.6 April 4, 2014 of NXP Semiconductor).

Serial Signal Format

The SDA line must be stable during the high period of the SCL. SDA transitions are allowed only during SCL low level for data communication. Only one transition is allowed during the low SCL state to communicate one bit of data. Figure 39 shows the detailed timing diagram.

An idle I^2C bus state occurs when both SCL and SDA are not being driven by any master and are therefore in a logic HI state due to the pull up resistors. Every transaction begins with a START (S) signal and ends with a STOP (P) signal. A START condition is defined by a high to low transition on the SDA while SCL is high. A STOP condition is defined by a low to high transition on the SDA while SCL is high. START and STOP conditions are always generated by the master. This slave module also supports repeated START (Sr) condition which is same as START condition instead of STOP condition (the blue-color line shows repeated START in Figure 40).

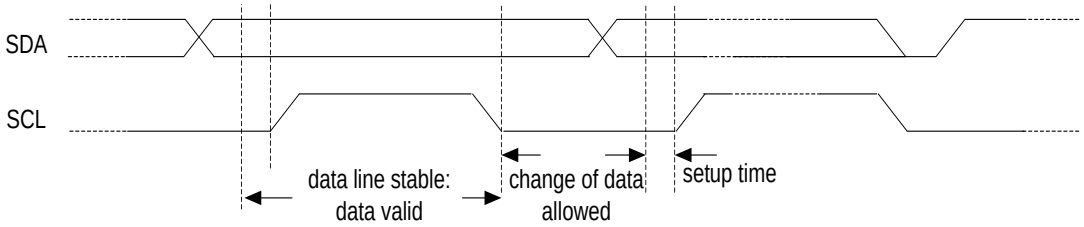

Figure 39. Data and clock timing relation in I^2C bus

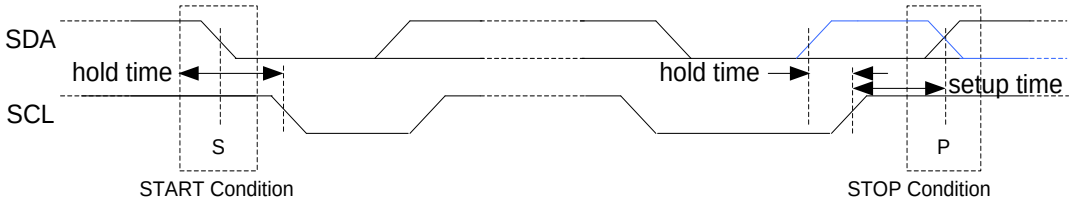

Figure 40. START and STOP (or repeated START, blue line) condition

Downloaded from Arrow.com.

Parallel Signal Format

Every data byte is 8 bits long. The number of bytes that can be transmitted per transfer is unrestricted. Data is transferred with the MSB (Most Significant Bit) first. The detailed data transfer format is shown in Figure 42 below.

The acknowledge bit must occur after every byte transfer and it allows the receiver to signal the transmitter that the byte was successfully received and another byte may be sent. The acknowledge signal is defined as follows: the transmitter releases the SDA line during the acknowledge clock pulse so the receiver can pull the SDA line low and it remains stable low during the high period of this clock pulse. Setup and hold times must also be taken into account. When SDA remains high during this ninth clock pulse, this is defined as the Not-Acknowledge signal (NACK). The master can then generate either a STOP condition to abort the transfer, or a repeated START condition to start a new transfer. The only condition that leads to the generation of NACK from the SiT5357 is when the transmitted address does not match the slave address. When the master is reading data from the SiT5357, the SiT5357 expects the ACK from the master at the end of received data, so that the slave releases the SDA line and the master can generate the STOP or repeated START. If there is a NACK signal at the end of the data, then the SiT5357 tries to send the next data. If the first bit of the next data is “0”, then the SiT5357 holds the SDA line to “0”, thereby blocking the master from generating a STOP/(re)START signal.

Parallel Data Format

This I^2C slave module supports 7-bit device addressing format. The 8^{th} bit is a read/write bit and “0” indicates a read transaction and a “1” indicates a write transaction. The register addresses are 8-bits long with an address range of 0 to 255 (00h to FFh). Auto address incrementing is supported which allows data to be transferred to contiguous addresses without the need to write each address beyond the first address. Since the maximum register address value is 255, the address will roll from 255 back to 0 when auto address incrementing is used. Obviously, auto address incrementing should only be used for writing to contiguous addresses. The data format is 16-bit (two bytes) with the most significant byte being transferred first.

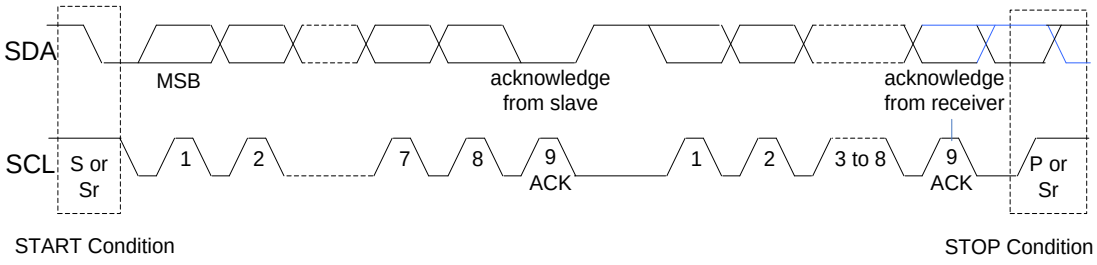

Figure 41. Parallel signaling format

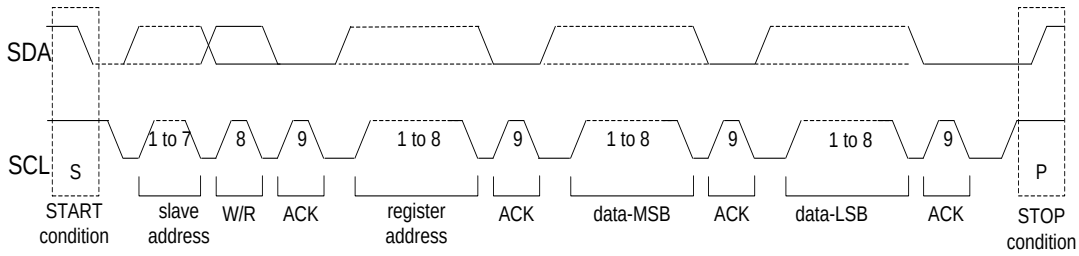

Figure 42. Parallel data byte format

I²C Device Address Modes

There are two I²C address modes:

1) Factory Programmed Mode. The lower 4 bits of the 7-bit device address are set by ordering code as shown in Table 20 below. There are 16 factory programmed addresses available. In this mode, pin 5 is NC and the A0 I²C address pin control function is not available.

2) A0 Pin Control. This mode allows the user to select between two I²C Device addresses as shown in Table 21.

Table 20. Factory Programmed I²C Address Control[15]

I²C Address Ordering Code	Device I²C Address
0	1100000
1	1100001
2	1100010
3	1100011
4	1100100
5	1100101
6	1100110
7	1100111
8	1101000
9	1101001
A	1101010

Dimensions and Patterns

Package Size – Dimensions (Unit: mm)

		SYMBOL	MIN	NOM	MAX
TOTAL THICKNESS		A	0.840	0.950	1.060
BODY SIZE	X	D	4.850	5.000	5.150
	Y	E	3.050	3.200	3.350
LEAD PITCH		e	1.070	1.200	0.330
		e1	1.200	1.350	1.480
		e2	0.970	1.100	1.230
LEAD LENGTH		L	0.970	1.100	1.230
		L1	0.770	0.900	1.030
LEAD WIDTH		W	0.470	0.600	0.730
		W1	0.670	0.800	0.930
		W2	0.470	0.600	0.730

NOTES

1. Dimensioning and tolerancing conform to ASME Y14.5-2009.
2. All dimensions are in millimeters.

Layout Guidelines

- The SiT5357 uses internal regulators to minimize the impact of power supply noise. For further reduction of noise, it is essential to use two bypass capacitors (0.1 µF and 10 µF). Place the bypass capacitors as close to Vdd pin as possible, typically within 1 to 2 mm. Ensure that the 0.1µF cap is closer to the device Vdd and GND power pins.
- It is also recommended to connect all NC pins to the ground plane and place multiple vias under the GND pin for maximum heat dissipation.
- For additional layout recommendations, refer to the Best Design Layout Practices.

Manufacturing Guidelines

The SiT5357 Super-TCXOs are precision timing devices. **Proper PCB solder and cleaning processes** must be followed to ensure best performance and long-term reliability.

- **No Ultrasonic or Megasonic Cleaning:** Do not subject the SiT5357 to an ultrasonic or megasonic cleaning environment. Otherwise, permanent damage or long-term reliability issues to the device may result.
- **No external cover.** Unlike legacy quartz TCXOs, the SiT5357 is engineered to operate reliably, without performance degradation, in the presence of ambient disturbers such as airflow and sudden temperature changes. Therefore, the use of an external cover typically required by quartz TCXOs is not needed.
- **Reflow profile:** For mounting these devices to the PCB, IPC/JEDEC J-STD-020 compliant reflow profile must be used. Device performance is not guaranteed if soldered manually or with a non-compliant reflow profile.
- **PCB cleaning:** after the surface mount (SMT)/reflow process, solder flux residues may be present on the PCB and around the pads of the device. Excess residual solder flux may lead to problems such as pad corrosion, elevated leakage currents, increased frequency aging, or other performance degradation. For optimal device performance and long-term reliability, thorough cleaning and drying of the PCB is required as shortly after the reflow process as possible, even when using a “no clean” flux. Care should be taken to remove all residual flux between the SiTime device and the PCB. Note that ultrasonic PCB cleaning should not be used with SiTime oscillators.
- For additional manufacturing guidelines and marking/ tape-reel instructions, refer to SiTime Manufacturing Notes.

Table 23. Revision History

Version	Release Date	Change Summary
0.1	05/10/2016	First release, advanced information
0.15	08/04/2016	Replaced QFN package with SOIC-8 package Added 10 µF bypass cap requirement Updated test circuits to reflect both new bypass cap requirement and SOIC-8 package Update Table 1 (Electrical Characteristics)
0.16	09/12/2016	Updated test circuit diagrams
0.2	09/21/2016	Revised Table 1 (Electrical Characteristics)
0.51	08/20/2017	Changed to preliminary Added DCTCXO mode Added I2C information Added 5.0x3.2 mm^2 package information Updated test circuits Updated Table 1 (Electrical Characteristics) Updated part ordering info Misc. corrections
0.52	11/27/2017	Updated the Thermal Characteristics table Added more on Manufacturing Guideline section
0.55	02/05/2018	Added View labels to Package Drawings Updated links and notes
0.60	03/01/2018	Added 105°C support, updated Ordering Information
1.0	06/26/2018	Updated Electrical Characteristics tables. Added Typical Performance Plots. Improved readability. Fixed bad hyperlinks.
1.01	07/03/2018	Updated I2C specifications, Table 3 (Input Characteristics).
1.02	07/04/2018	Updated Mechanical Shock Resistance, Table 9 (Environmental Compliance).
1.03	08/02/2018	Various formatting updates. Updated package outline drawing. Revised phase noise specifications. Updated conditions for one day and one year aging specs.
